

Integrated Weed Management: Rationale and Strategies

Sarah Lancaster
 Assistant Professor and Weed Science Extension Specialist
 Kansas State University

Integrated weed management

Using multiple, complementary weed control practices

Integrated weed management

Chemical

Sequential
 Residual
 Multiple sites of action
 Well-timed

Cultural

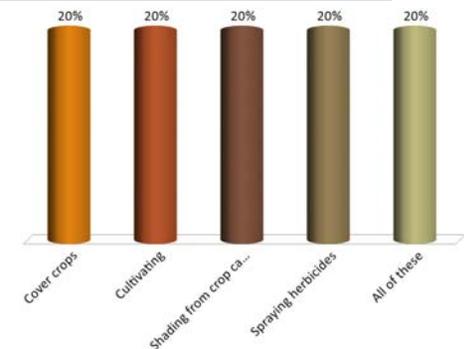

Good agronomic practices
 Crop rotation
 Seeding date
 Row spacing
 Plant populations

Physical

Tillage
 Cover crops

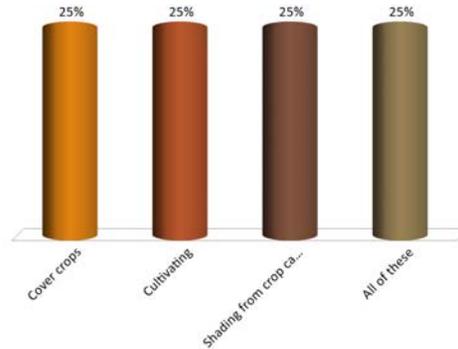

Which of the following IWM practices do you use most?

- A. Cover crops
- B. Cultivating
- C. Shading from crop canopy
- D. Spraying herbicides
- E. All of these

Which of the following IWM practices do you use most?

- A. Cover crops
- B. Cultivating
- C. Shading from crop canopy
- D. All of these

Why integrated weed management?

Herbicide resistance

Sustainability

Herbicide resistance

Herbicide tolerance

The inherited ability of a species to survive and reproduce following herbicide application

- Naturally occurring trait
- Expected result due to herbicide selectivity

Herbicide selectivity

Application rate

Placement

Absorption and translocation

Metabolism or altered metabolism

Altered site of action

UGA2100036

Herbicide resistance

The ability of a formerly susceptible plant population to survive herbicide doses greater than those that were once used to control the original plant population

- Herbicide resistance is a heritable trait

Herbicide resistant weeds in Kansas

	Palmer amaranth	Waterhemp	Kochia	Marestail
ALS inhibitors Group 2 (Classic, Harmony, Pursuit)	X	X	X	X
Plant growth regulators Group 4 (2,4-D, dicamba, Starane Ultra)	X		X

Do you think you have weeds resistant to HPPD inhibitors?

- A. True
- B. False

CROSS RESISTANCE

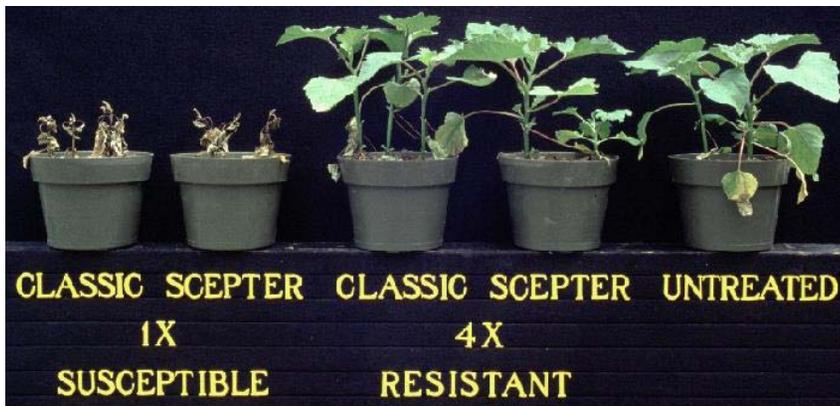

Single mechanism confers resistance to multiple herbicides

Negative cross resistance – genetic change that causes resistance to one herbicide causes ‘hypersusceptibility’ to another

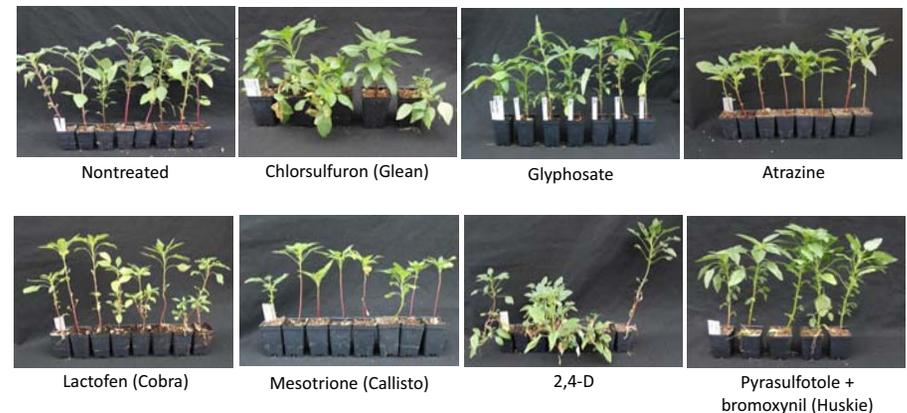

MULTIPLE RESISTANCE

Multiple mechanisms confer resistance to multiple herbicides

Cross resistant common cocklebur

Multiple resistant Palmer amaranth

Causes of resistance

TARGET-SITE MUTATION

One gene

Develops faster

Most cases observed in

- ACCase inhibitors (G1)
- ALS inhibitors (G2)
- PSII inhibitors (G5)

NON-TARGET-SITE MUTATION

> 1 gene

Develops slower

- Begins with low degree of resistance
- Cross resistance more likely

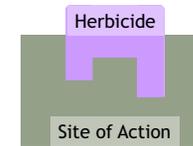

Most frequent form observed in

- ACCase inhibitors
- ALS inhibitors
- EPSPS inhibitor

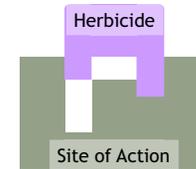

Altered Site of Action

Plant changes target site

Susceptible

Resistant

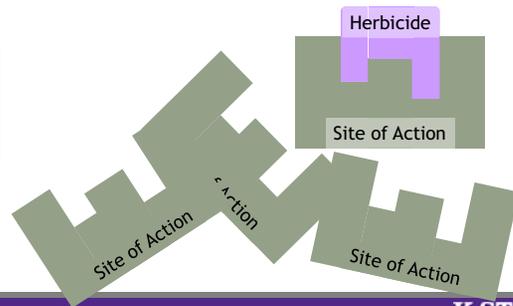

Increased Protein Expression

Plant produce more copies of the target site

Susceptible

Resistant

Causes of resistance

TARGET-SITE MUTATION

One gene

Develops faster

Most cases observed in

- ACCase inhibitors (G1)
- ALS inhibitors (G2)
- PSII inhibitors (G5)

NON-TARGET-SITE MUTATION

> 1 gene

Develops slower

- Begins with low degree of resistance

Cross resistance more likely

Most frequent form observed in

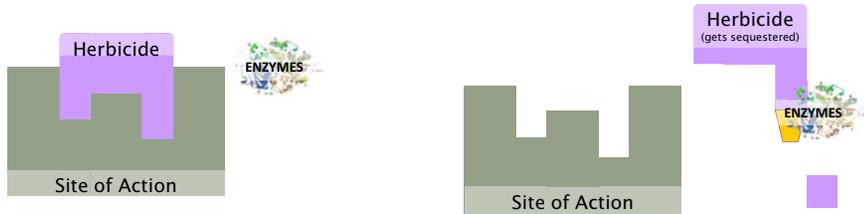

- ACCase inhibitors
- ALS inhibitors
- EPSPS inhibitor

Enhanced Herbicide Metabolism

Plant alters &/or sequesters herbicide, making it ineffective

Susceptible

Resistant

K-STATE
Research and Extension

Reduced Absorption or Translocation

Herbicide transport altered

Best Management Practices

for Herbicide Resistance

- 1 Understand the biology of the weeds present.
- 2 Use a diversified approach toward weed management. Focus on preventing weed-seed production and reducing the number of weed seeds in the soil seedbank.
- 3 Plant into weed-free fields and then keep fields as weed-free as possible.
- 4 Plant weed-free crop seed.
- 5 Scout fields routinely.
- 6 Use multiple herbicide modes of action (MOAs) that are effective against the most troublesome weeds or those most prone to herbicide resistance.
- 7 Apply the labeled herbicide rate at recommended weed sizes.
- 8 Emphasize cultural practices that suppress weeds by using crop competitiveness, mowing rapid-growing bushy crops do a better job of suppressing weeds than slow-growing upright crops that produce few leaves.
- 9 Use mechanical and biological management practices where appropriate.
- 10 Prevent field-to-field and within-field movement of weed seed or vegetative reproductive structures.
- 11 Manage weed seed at harvest and after harvest to prevent a buildup of the weed seedbank.
- 12 Prevent an influx of weeds into the field by managing field borders.

Scouting

Get a representation of the whole field

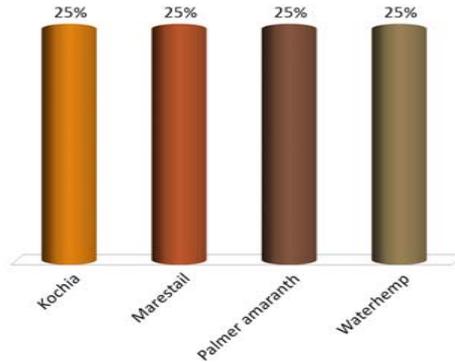

- 5-10 stops, spread throughout
- At each stop, walk 10 paces and record the following:
 - Weed species present – ID is critical
 - Life stage or height of weeds
 - Lifecycle (summer annual, winter annual, perennial)
 - Severity of the infestation based on number of plants (Low, medium, high)

Before planting, before herbicide, **after herbicide**

Best Management Practices for Herbicide Resistance

Understanding sites of action

Mode of action

- How the herbicide affects the plant
 - Amino acid synthesis inhibitor

Site of action

- Specific binding site the herbicide interferes with
 - EPSPS inhibition
 - Group 9

Chemical family

- Elements in the molecule
 - Glycine

Herbicide sites of action

Group	Site of Action (Mode of Action)
1	ACCase inhibitors (Lipid synthesis inhibitors)
2, 9	ALS inhibitors, EPSP Synthase inhibitor (Amino acid synthesis inhibitors)
3	Microtubule inhibitors (Seedling root growth inhibitors)
4, 19	Synthetic auxins, Auxin transport inhibitors (Growth regulators)
5, 6, 7	PS II inhibitors-3 unique sites of action (Photosynthesis inhibitors)
8, 15, 16	Lipid synthesis inhibitors, Long-chain fatty acid inhibitors, Site unknown (Seedling shoot growth inhibitors)
10	Glutamine synthetase inhibitor (Nitrogen metabolism inhibitor)
12, 13, 27	PDS inhibitor, DOXP inhibitor, HPPD inhibitors (Pigment inhibitors)
14, 22	PPO inhibitors, PSI electron diverter (Cell membrane disruptors)
17	Nucleic acid inhibitor (Undefined)

49 species with resistance

ALS Inhibitors (2)

Inhibit acetolactate synthase (aka acetohydroxy acid synthase)

- Necessary to produce branched chain amino acids (valine, leucine, isoleucine)

Classic
HERBICIDE

Pursuit
Herbicide

For use on alfalfa, beans and peas, birdfoot trefoil, clover, edamame, peanut, and soybean.

Active Ingredient:
acetochloric acid (2-(4,5-dihydro-4-methyl-4H-pyrimidin-5-yl)-5-oxo-1H-imidazol-2-yl)-5-ethyl-5-cyanoacetic acid 22.87%

Other Ingredients: 77.13%

Total: 100.00%

GROUP	HERBICIDE
acetochloric acid (2-(4,5-dihydro-4-methyl-4H-pyrimidin-5-yl)-5-oxo-1H-imidazol-2-yl)-5-ethyl-5-cyanoacetic acid	22.87%
Other Ingredients	77.13%
Total	100.00%

ALS-inhibitor injury to soybean

Symptoms in 3-14 d

- Shoots stop growing and turn yellow,
- Purple veins – dicots
- “Bottlebrush” roots

Research and Extension

26 species with resistance

Photosynthesis Inhibitors (5)

Bind to D1 protein in PSII

- Blocks electron transport
- Stops CO₂ fixation, ATP & NADPH production
- Reactive oxygen and chlorophyll form, chlorophyll lost, reactive species cause lipid peroxidation, which causes leaky membranes (with 5-10 h)

Triazine injury to soybean

Symptoms appear first on older leaves, death in 5-10 days

- Leaf tip & margin necrosis
- Interveinal chlorosis

2 species with resistance

Pigment Inhibitors (Group 27)

Carotenoids are necessary to dissipate reactive oxygen

- Without carotenoids, reactive oxygen peroxidizes lipids, destroying membranes

Callisto injury to grain sorghum

Symptoms include white/creamy colored leaves

- AKA “bleachers”

4 species with resistance

PPO inhibitors (14)

Inhibit protoporphyrinogen oxidase

- Necessary to produce chlorophyll
- Accumulated protoporphyrin IX results in formation of reactive oxygen and lipid peroxidation

Sharpen
Powered by Kixor® Herbicide

For use in selected agricultural crops

Active Ingredients:
 isopropyl 3-(2-chloro-4-fluoro-5-(3-methyl-2,6-dioxo-4-thiuronamethyl)-3,6-dihydro-12H-pyrimidin-7-yl)pyridin-2-ylidene-N-propyl-N-methylsulfamate 29.74%
 Other Ingredients: 70.26%
 Total: 100.00%

SPARTAN

4F Herbicide

For Use Only by Individuals/Firms Certified And/or Licensed as Pesticide Applicators

EPA Reg. No. 279-0220 EPA Est. 279-RL-1
 Active Ingredients (1.9) 95.9%
 Sulfentrazone 95.9%
 Inert Ingredients 4.1%
 Total 100.0%

VALOR
HERBICIDE **EZ**

FOR CONTROL AND/OR SUPPRESSION OF CERTAIN WEEDS IN CLOVER, COTTON, DRY BEANS, FIELD CORN, FIELD PEAS, FLAX, LENTILS, PEANUT, SOYBEAN, SUGARCANE, SUNFLOWER AND SAFFLOWER, SWEET POTATO, WHEAT, FALLOW LAND AND TO MAINTAIN BARE GROUND ON NON-CROP AREAS OF FARMS.

Active Ingredient By Wt
 Flumioxazin 41.4%
 Other Ingredients 58.6%

Cobra and Reflex injury on soybeans

Symptoms appear in 3 days

- Bronzing, necrosis
- Drawstring leaves

IMAGE: D. PETERSON

K-STATE
Research and Extension

3 species with resistance

Long -chain Fatty acid Inhibitors (15)

Interfere with very long chain fatty acid synthesis

Zidua
Herbicide

A selective residual herbicide for use in agricultural crops

Active Ingredient:
 pyroxasulfone: 3-[[5-(difluoromethoxy)-1-methyl-3-(trifluoromethyl)-1H-pyrazol-4-yl]methyl]sulfanyl]-4,5-dihydro-5,5-dimethylisoxazole 85.0%
 Other Ingredients: 15.0%
 Total: 100.0%

Dual II Magnum
Herbicide
syngenta

For seed control in beans, peas, and lentils; corn; cotton; grasses grown for seed; horsechick, peanuts, cottons, pumpkin, nuttall, safflowers; sweet, grain, or long-grained soybeans; soybeans, lentils; seed, sugar beets, sunflowers, and tomatoes.

Active Ingredient: S-metolachlor (CAS No. 87380-13-8) 82.4%
 Other Ingredients: 17.6%
 Total: 100.0%

CR-234234234114234 ^a	14	20	7	19	23	7	11	14	5	4 ^a

^a N indicates that resistance did not occur within 60 years of simulation. In most cases the same result was found in all 100 replicate runs, in which case the single result is reported; otherwise the range is reported (e.g. 25-27 means resistance occurred as late as 27 years and as early as 25 years) and, if relevant, the percentage of replicate runs in which resistance did not occur within 60 years of simulation. The rank column indicates the relative efficacy of the strategy in delaying resistance under GS1, which is not affected by allele frequency GS3 versus GS1 (1 = most effective; 7 = least effective). Bold values indicate where GS2 makes a difference versus GS1.

^b These simulations assumed existing trifluralin resistance and are ranked separately.

- 1, trifluralin (dinitroaniline, G3);
- 2, proflurocarb + S-metolachlor (thiocarbamate + chloroacetamide, G8 + 15);
- 3, pyroxasulfone (pyrazole, G15);
- 4, propyzamide (benzamide, G3).

Best Management Practices for Herbicide Resistance

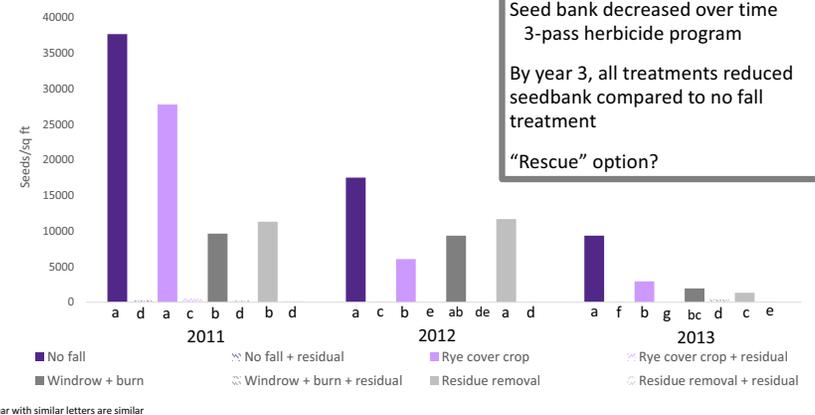

- Understand the biology of the weeds present.
- Use a diversified approach toward weed management. Focus on preventing weed seed production and reducing the number of weed seeds in the soil seedbank.
- Plant into weed-free fields and then keep fields as weed-free as possible.
- Plant weed-free crop seed.
- Scout fields routinely.
- Use multiple herbicide modes of action (MOA) that are effective against the most troublesome weeds or those most prone to herbicide resistance.
- Apply the labeled herbicide rate at recommended weed sizes.
- Emphasize cultural practices that suppress weeds: by using crop competition, making rigid-growing bushy crops do a better job of suppressing weeds than slow-growing upright crops that produce few leaves.
- Use mechanical and biological management practices where appropriate.
- Prevent field-to-field and within-field movement of weed seed or vegetative reproductive structures.
- Manage weed seed at harvest and after harvest to prevent a buildup of the weed seedbank.
- Prevent an influx of weeds into the field by managing field borders.

Wrap up

Various forms of herbicide resistance are common in Kansas in multiple species

Using cultural or mechanical weed management can improve activity of herbicides and reduce selection pressure leading to herbicide resistant weed populations

Mixing multiple herbicide groups is more effective than rotating herbicide groups

Consider practices to reduce deposits to weed seedbank

15 species with resistance

ACCase Inhibitors (1)

Inhibit acetyl Coenzyme A carboxylase in grasses

- Required for lipid synthesis within the plant
- Prevents cell membrane development

Poast Plus herbicide	
Active Ingredient:	
sethoxydim, 2-[1-(ethoxymethylbutyl)-5-(2-(ethylthio)propyl)-3-hydroxy-2-cyclohexen-1-one]	13.0%
Other Ingredients:	87.0%
Total:	100.0%

DuPont™ Assure® II HERBICIDE	
GROUP	HERBICIDE
Emulsifiable Concentrate	By Weight
Active Ingredients:	
Quinclorac-P-ethyl	89.2%
Other Ingredients:	10.8%
TOTAL:	100.0%
